Questions

Coordinate Patch  $\mu:U\to V$ : continuous functions mapping from  $U\subseteq\mathbb{R}^2$  to a subset of the surface V

Chart: covers entire surface

#### Regular Surfaces:

- ▶ Differentiable the coordinate functions of  $\mu$  in  $\mathbb{R}^3$  have continuous partial derivatives for all orders
- lacktriangle Homeomorphic  $\mu$  and its inverse are continuous
- $\blacktriangleright$  Satisfies the Regularity Condition The differential of  $\mu$  is a one-to-one linear transformation

### Charts

esults

$$\phi: \mathbb{R}^2 \to P$$

$$\phi(u, v) = (u, v, 0)$$

### Charts

#### Random Walks

#### Tom Eichlersmith

Introduction

Background

Method

Results

$$\sigma : \mathbb{R}^2 \to S$$

$$\sigma(u, v) = \left(\frac{2u}{1 + u^2 + v^2}, \frac{2v}{1 + u^2 + v^2}, \frac{-1 + u^2 + v^2}{1 + u^2 + v^2}\right)$$

### Charts

$$\tau : [0,1) \times [0,1) \to T(R,r)$$

$$\tau(u,v) = \Big( (R + r\cos(2\pi v))\cos(2\pi u),$$

$$(R + r\cos(2\pi v))\sin(2\pi u),$$

$$r\sin(2\pi v) \Big)$$

### Geodesic Equations

Random Walks

Tom Eichlersmith

Introduction

Background

Method

- 1. Extend definition of line to other surfaces
- 2. Assume a path is a geodesic contained in a coordinate patch
- 3. Derive geodesic equations for coordinate functions of path

Runge-Kutta 4th Order Method (RK4)

$$\frac{dy}{dt} = F(y) \quad y_0 = y(0)$$

Numerically solve up to t = h with N iterations.

$$\delta \leftarrow h/N$$

$$y \leftarrow y_0$$

$$loop \ N \ times:$$

$$k_1 \leftarrow F(y)$$

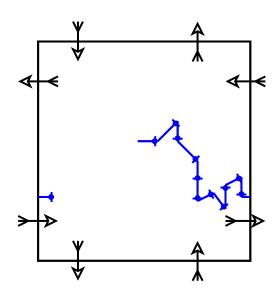

$$k_2 \leftarrow F(y + (\delta/2)k_1)$$

$$k_3 \leftarrow F(y + (\delta/2)k_2)$$

$$k_4 \leftarrow F(y + \delta k_3)$$

$$y \leftarrow y + (\delta/6)(k_1 + 2k_2 + 2k_3 + k_4)$$

### **Coordinate Wrapping**

### **Optimizations**

Random Walks
Tom Eichlersmith

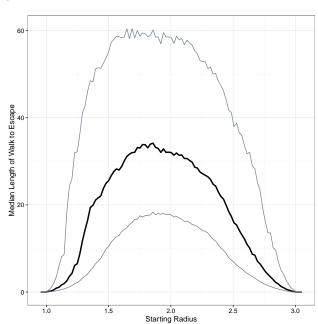

Dackgroui

Method

Result

- ► Collection of every step point
- Number of steps in RK4
- Simplifications due to symmetry
  - ▶ Plane with radius representation
  - Sphere with polar angle representation
- Method of "compressing" the data
